

Mathematic condensed function for verify data integrity

This Function is similar to (SHA), and is part of the Mona-UPL project.  
 The developer platform is LabView of National Instruments ©  
 All others modules are ready, due commercial reasons I can't release that at this point.

What are include on this project?

- A new dynamic way for encrypt data (a big problem for lover of the brute force).
- New visual challenge for separate machine (bot) from humans.
- A new way for indexing and carry the data (no Mather the size) and more...

This was brought to you by Azazel0101 and J. C. Gomez (is the same but only in my world)
